

Ona Platform: AI-Driven Energy Asset Management

The Intelligence Layer for predictive maintenance, compliance, and energy trading

The Fragmented Intelligence Problem

Your Portfolio. Six Systems. Zero Alignment.

Asset managers today face a critical reality: **fragmented intelligence**.

You are managing distributed energy assets across operational, financial, and market domains, yet your systems speak different languages.

From Huawei portals to manual Excel models and disconnected risk assessments, no single system sees the full picture. The result is delayed trading decisions, reactive maintenance, and **missed optimization opportunities**.

The Hidden Cost of Fragmentation

When intelligence is siloed, revenue is lost. The impact is quantifiable across every dimension of your portfolio.

Market Operations

\$47K–\$186K lost per MW annually due to missed trading optimization.

- Delayed dispatch during penalty windows.
- Manual forecasting fails against intraday volatility.
- 70% of penalties are preventable with real-time data.

Asset Performance

4–8 hour detection delays extend downtime during peak generation.

- 25–30% false alarm rate wastes O&M budget.
- Reactive maintenance costs 15–25% in lost generation.
- Manual detection misses subtle early warnings.

Financial & Compliance

3 days per asset, per month wasted on manual regulatory reporting.

- Revenue projections rely on quarterly, stale data.
- Risk assessments disconnected from operational reality.
- Compliance tracking lags weeks behind actuals.

The Ona Intelligence Layer

Ona unifies operational, financial, and market intelligence into a single platform—regardless of asset type, OEM, or location.

Market Operations

Real-time dispatch optimization with 30-minute forecast updates. We automate grid code compliance and provide "Penalty-at-Risk" analytics, reducing unplanned penalties by 70%.

Asset Performance

Predictive maintenance with 30+ day advance warnings. Our system detects faults in under 10 minutes (vs. industry standard 4–8 hours) and facilitates cross-portfolio learning.

Financial Intelligence

Revenue projections with confidence intervals (5th–95th percentile). We automate covenant compliance tracking and optimize portfolio-level EBITDA across diverse asset classes.

Regulatory Coordination

Automated policy compliance via our University of Johannesburg partnership. We enable Virtual Power Plant (VPP) aggregation and multi-asset dispatch for wheeling optimization.

❏ These aren't separate products. It is **unified intelligence** replacing the need for disparate systems, vendors, and analyst teams.

Platform Architecture

A robust three-layer approach ensures data sovereignty, real-time speed, and executive clarity.

Edge Layer: Real-Time Asset Intelligence

Predictive AI runs directly on assets via low-power compute. With 0-48 hour local forecasts and 2-5 second inference times, we eliminate cloud lag. Decisions are made on fresh SCADA data, ensuring trading desks operate on the "now."

Control Layer: Portfolio Coordination

This layer aggregates nodes, executes Decision AI for economic optimization, and maintains a unified dashboard. It balances maintenance timing against market prices and weather, integrating seamlessly via secure APIs (SAP, Maximo).

Interface Layer: Transparency, No Hallucinations

We use deterministic templates to eliminate AI fabrication risk. Users can trace data sources and examine model confidence scores. Executives get instant portfolio health visibility without analyst mediation.

Proven Results in Production

We don't just promise intelligence; we validate it across severe data challenges and complex multi-party environments.

Sibaya Casino: Limited Data

Problem: Only 6 months of history for a 1.5MW solar plant.

Result: Achieved **7% SMAPE accuracy** in 6 months (vs. 24+ month standard) using transfer learning from similar sites.

Cummins: Severe Data Loss

Problem: Portfolio suffering 65% missing data points.

Result: **100% data reconstruction** and zero grid violations. Fault detection speed improved by 96% despite infrastructure failure.

Avaron: Multi-Party Ops

Problem: Coordinating Owner, O&M, and Insurer.

Result: Unified data layer eliminated reconciliation. Economic optimization now considers insurance impact of maintenance timing.

Deployment Models: Start Where You Hurt

We offer flexible entry points. Solve your immediate pain, then expand to the full platform capabilities.

Model 1: Performance First

Best for: Operators with reactive maintenance.

Wk 1-4: SCADA integration & Predictive maintenance.

Mo 2-3: Energy-at-Risk calculations.

Mo 4+: Market coordination & VPP.

Model 2: Trading First

Best for: Traders needing better forecasts.

Wk 1-4: Intraday re-forecasting & Penalty-at-Risk.

Mo 2-3: Maintenance timing optimization.

Mo 4+: Regulatory & Compliance automation.

Model 3: Full Platform

Best for: Operators ready for unified intelligence.

- Simultaneous deployment across all asset classes.
- Unifies Operations, Trading, Finance, and Compliance.
- 13-week structured onboarding to full commercial value.

Ona vs. Alternatives

We are not replacing your core systems. We are the integration layer that finally makes them talk to each other.

vs. SCADA / OEM Solutions

Them: Siloed by vendor; no cross-asset insight.

Ona: We integrate across vendors. You keep your hardware relationships while gaining unified portfolio intelligence.

vs. Aurora Solar / Design Tools

Them: Great for design, not for operations.

Ona: We focus on *operational* and market intelligence. We integrate their design outputs to optimize live performance.

vs. Building In-House

Them: 24+ months to production; high maintenance burden.

Ona: 6-9 months to validated results. Validated transfer learning lets you focus on strategy, not infrastructure.

vs. Manual Workflows

Them: Stale data, reactive decisions, burnt-out analysts.

Ona: Automated workflows and proactive intelligence. 4x faster workflows allow for 20+ additional proposals per year.

Commercial Structure

Flexible engagement models designed for both enterprise operators and agile tech providers.

Track 1: Enterprise Platform

For Portfolio Operators (5+ MW)

Integrated deployment including Edge hardware, Control Layer, and Dashboards.

Pricing: \$15K–\$45K per MW/year

Includes: Predictive maintenance, forecasting, compliance.

Support: Dedicated success manager & priority dev.

Track 2: API Services

For Traders, Insurers & Startups

Usage-based pricing for specific intelligence capabilities

Pricing: Per-call or subscription volume.

Services: Forecasting API, Data Conversion, Risk Scoring.

Flexibility: Pay-as-you-grow model.

The Mission: 100% Availability

The barriers to South Africa's energy transition aren't just capital or capacity. They are intelligence gaps.

600M

People

Lacking reliable electricity access across the continent.

\$3.1B

Market Potential

Untapped private electricity market value (vs \$394M captured).

Zero

Intelligence

Current state of cross-system alignment preventing optimization.

Ona is building the infrastructure that makes Africa's distributed energy transition work. By unifying assets, markets, and stakeholders, we turn distributed generation into coordinated, reliable capacity.

Next Steps: 13-Week Validation

We guarantee results. If we don't hit 2 of 4 key metrics (Latency, MTTR, False Positives, Data Completeness), you get a full refund.

Ready to unify your portfolio?

1. **Technical Call:** Validate data & integration. 2. **Scoping Workshop:** Map workflows. 3. **Pilot Agreement:** Define metrics. 4. **Kickoff:** Integration begins.
